

MVP

For the project the plan was to get the busiest stations in the city of New York and compare it with the wealthiest neighborhoods in the city.

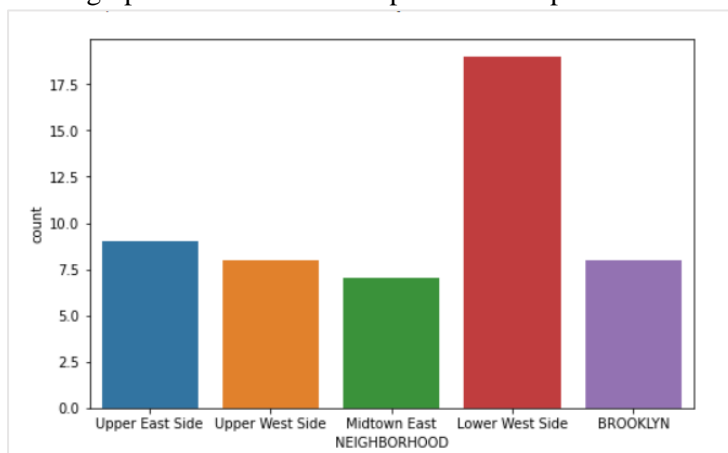

- The data is cleaned from negative entries.
- Added a new column with the day of week that correspond to the date.
- Get the busiest stations and plot it in a bar chart diagram.

- In the graph above we can clearly see the top 10 stations.

- In this graph we can see the box plot for the top ten busiest stations in the city.

- This figure shows the neighborhoods with the highest number of stations from the additional dataset I am working on.
